Semantic Design for the Observable-Property System

```
let Propertied = Axiom "Something with observable properties."
let PropertyChangeHandler = PropertySystem -> PropertySystem -> PropertySystem
and PropertyChangeUnhandler = PropertySystem -> PropertySystem
and PropertySystem = Axiom "An observable-property system."

let getPropertyOpt<a> : String -> Propertied? -> PropertySystem -> Maybe<a> =
    Axiom "Obtain a participant property if it exists."

let setPropertyOpt<a> : String -> Propertied? -> Maybe<a> -> PropertySystem -> PropertySystem =
    Axiom "Set a participant property if it exists."

let handlePropertyChange : String -> Propertied? -> PropertyChangeHandler -> (PropertyChangeUnhandler, PropertySystem) =
    Axiom "Invoke the given handler when a participant property is changed."

// TODO: See what categories the property system yields and make witnesses for them.
```

Semantic Design for the Publisher-Neutral Event System

```
let Address<a> = List<String>
let Participant = (_ : Axiom "A participant in the event system.", Propertied)
let Event<a, s :> Participant> = (Data : a, Publisher : Simulant, Subscriber : s, Address : Address<a>)
let EventSystem = (_ : Axiom "A publisher-neutral event system."; PropertySystem)
let EventHandler<a, s :> Participant> = Event<a, s> -> EventSystem -> EventSystem
let EventUnhandler = EventSystem -> EventSystem
let Stream<a> = Axiom "A stream of data flowing from events."
let Chain<e, a> = Axiom "A programmable 'chain' of events."

let getLiveness : EventWorld -> Bool =
    Axiom "Check that the event system is either live or terminated."

let participantExists : Participant? -> EventWorld -> bool =
    Axiom "Check that a participant exists."

let publish<a, p :> Participant> : a -> Address<a> -> p -> EventSystem -> EventSystem =
    Axiom "Publish an event with the given data with the given event address for the given participant."

let subscribe<a, s :> Participant> : Address<a> -> s -> EventSystem -> EventHandler<a, s> -> (EventUnhandler, EventSystem)
    Axiom "Subscribe to an event with the given event address with the given subscriber."

let mapStream<a, b> : (a -> b) -> Stream<a> -> Stream<b> =
    Axiom "Map over a stream."

let foldStream<a, b> : (b -> a -> b) -> b -> Stream<a> -> b =
    Axiom "Fold over a stream."

let map2Stream<a, b, c> : (a -> b -> c) -> Stream<a> -> Stream<b> -> Stream<c> =
    Axiom "Map over two stream."

let productStream<a, b> : Stream<a> -> Stream<b> -> Stream<(a, b)> =
    Axiom "Make a pairwise product from two streams."

let sumStream<a, b> : Stream<a> -> Stream<b> -> Stream<Either<a, b>> =
    Axiom "Make an either sum from two streams."

let pureChain<a> : a -> Chain<e, a> =
    Axiom "Construct a chain from a single value."

let bindChain<e, a> : Chain<e, a> -> (b -> Chain<e, b>) -> Chain<e, b> =
    Axiom "A monadic bind over a chain"
```

```
witness functor =
    | map = mapStream

witness Foldable =
    | fold = foldStream

witness Functor2 =
    | map2 = map2Stream

witness Summable =
    | product = productStream
    | sum = sumStream

// TODO: see if we can witness Monad fully for Chain...
witness Monad =
    | pure = pureChain
    | map = ???
    | apply = ???
    | bind = bindChain
```

Semantic Design for Nu Game Engine

```
let World = (_ : Axiom "The world value."; EventSystem)
let Simulant = (SimulantAddress : Address<Simulant>; Participant)
let Game = (GameAddress : Address<Game>; Simulant)
let Screen = (ScreenAddress : Address<Screen>; Simulant)
let Layer = (LayerAddress : Address<Layer>; Simulant)
let Entity = (EntityAddress : Address<Entity>; Simulant)
let Dispatcher = Axiom "Specifies the shape and behavior of a simulant."

let getGame : World -> Game = Axiom "Get the global game handle."
let getScreens : World -> List<Screen> = Axiom "Get all screen handles belonging to the global game."
let getLayers : Screen -> World -> List<Layer> = Axiom "Get all layer handles belonging to the given screen."
let getEntities : Layer -> World -> List<Entity> = Axiom "Get all entity handles belonging to the given layer."
