

The following is an attempt to write a denotational semantics for Nu's scripting system, based on <https://www.youtube.com/watch?v=bmKYiUOEo2A>. This presentation uses a more improvised style of syntax than the Conal's, however.

Axiomatic Denotations - When a μ is defined in terms of itself, we consider it axiomatic and irreducible directly in this context.

```
 $\mu$ :Value<a> =
|  $\mu$ :Value< $\mu$ :Relation>
|  $\mu$ :Value< $\mu$ :Address>
|  $\mu$ :Value< $\mu$ :Name>
|  $\mu$ :Value< $\mu$ :String>
|  $\mu$ :Value< $\mu$ :Bool>
|  $\mu$ :Value< $\mu$ :Unit>
```

```
 $\mu$ :Stream<a> =
|  $\mu$ :Address ->  $\mu$ :Stream<a>
|  $\mu$ :Name ->  $\mu$ :Relation ->  $\mu$ :Stream<a>
|  $\mu$ :Stream< $\alpha\alpha$  -> a) ->  $\mu$ :Stream<a>
|  $\mu$ :Stream< $\alpha\mu$ :Stream< $\beta\mu$ :Stream<a when a =  $\alpha$  *  $\beta$ >
|  $\mu$ :Stream< $\alpha\mu$ :Stream< $\beta\mu$ :Stream<a when a =  $\alpha$  |  $\beta$ >
```

```
 $\mu$ :Effect =  $\mu$ :Effect // transforms the environment
```

```
 $\mu$ :Declare a =  $\mu$ :Name ->  $\mu$ :Declaration a // augments the environment
```

Derived Denotations

```
 $\mu$ :Get<a> =  $\mu$ :Name ->  $\mu$ :Relation ->  $\mu$ :Value<a>
```

```
 $\mu$ :Set<a> =  $\mu$ :Name ->  $\mu$ :Relation ->  $\mu$ :Value<a> ->  $\mu$ :Effect
```

```
 $\mu$ :Command<a> =  $\mu$ :Value<a> ->  $\mu$ :Effect
```

```
 $\mu$ :Fold<a b> = ( $\mu$ :Value<a> -> b) ->  $\mu$ :Stream<a> -> b
```

```
 $\mu$ :Define<a> =  $\mu$ :Declare< $\mu$ :Value<a>>
```

```
 $\mu$ :Variable<a> =  $\mu$ :Declare< $\mu$ :Stream<a>>
```

```
 $\mu$ :Equate<a> = \name -> \rel ->  $\mu$ :Stream<a> ->  $\mu$ :Fold ( $\mu$ :Set<a> name rel)
```

```
 $\mu$ :Handle<a> =  $\mu$ :Stream<a> ->  $\mu$ :Fold  $\mu$ : Command <a>
```
