<u>Semantic Design</u>

The following is what I call a 'semantic design' for Nu's scripting system (as well as an unrelated replacement for micro-services called MetaFunctions). The concept of a semantic design is inspired by Conal Elliot's denotational design –
https://www.youtube.com/watch?v=bmKYiUOEo2A.

To specify semantic designs generally, I've created a meta-language called SEDELA (for <u>Se</u>mantic <u>De</u>sign <u>La</u>nguage). First, we present the definition of SEDELA, then the semantic design for Nu's scripting system as well MetaFunctions in terms of SEDELA. Although I may aim to write a parser and type-checker for SEDELA, there will never be a compiler or intepreter. Thus, SEDELA will have no syntax for **if** expressions and the like. The only Meanings (SEDELA's nomenclature for functions) defined in the Prelude will be combinators such as id, const, flip, and etc. SEDELA's primitive types are all defined in terms of Axioms (types without formal definitions) with no available operations.

<u>Sedela Language Definition</u>

```
Axiom :=           Axiom[!] "Informal definition."                  where ! denotes intended effectfulness

Meaning Type :=    A -> ... -> Z                                    where A ... Z are Type Expressions

Meaning Defn :=    f (a : A) ... (z : Z) : R = Expression | Axiom   where f is the Meaning Identifier
                                                                    and a ... z are Parameter Identifiers
                                                                    and A ... Z, R are Type Expressions

Expression :=      Example: f a (g b)                               where f and g are a Meaning Identifiers
                                                                    and a and b are Paremeter Identifiers

Product :=         MyProduct<...> = A | (A : A, ..., Z : Z) | Axiom where MyProduct<...> is the Product Identifier
                                                                    and A ... Z are Field Identifiers
                                                                    and A ... Z are Type Expressions

Sum :=             MySum<...> =                                     where MySum<...> is the Sum Identifier
                    | A of (A | Axiom)                              and A ... Z are Case Identifiers
                    | ...                                           and A ... Z are Type Expressions
                    | Z of (Z | Axiom)

Type Identifier := Product Identifier | Sum Identifier

Type Expression := Meaning Type | Type Identifier

Type Parameters := Type Identifier<                                 where A ... Z are Type Expressions
                    A, ..., Z;                                      and A ... Z are Category Identifiers used for
                    A<A, ..., Z>; ...; Z<...>>                      constraining A ... Z

Category :=        category MyCat<...> =                            where MyCat<...> is the Category Identifier
                    | f : A                                         and f ... g are Equivilence Identifiers
                    | ...                                           and A ... Z are Types Expressions
                    | g : Z

Witness :=         witness A =                                      where A is a Category Identifier
                    | f (a : A) ... (z : Z) : R = Expression        and f ... g are Equivilence Identifiers
                    | ...                                           and a ... z are Parameter Identifiers
                    | g (a : A) ... (z : Z) : R = Expression        and A ... Z, R are Type Expressions

Categorization := Rule: iff type A has a witness for category A, A is allowable for type parameter categorized as A
```

Line Comment :=	**Example:** // comment text
fun *a b ... z -> expr* **:=**	*a* (*b* (... *z.expr*))
a **->** *b* **:=**	_ = (_ : *a*) : *b*
() **:=**	**Explanation:** The unit type / value.
f . g **:=**	**Explanation:** Function composition.
